

Mobile revision and recording of events

Not letting faith decide over anything

The App Observo allows the recording of free and object-based observations. The recording is geolocated and presented on the map.

Assignment of tasks

During the inspection of infrastructures such as buildings, roads, paths and bridges, as well as other facilities, certain occurrences may become apparent which must be documented. For example, it may be determined that a park bench is in need of repair; or that a tree requires felling due to it posing a hazard to the path, or that

deficiencies resulting from a state of decline must be recorded etc. In the event that observation data of occurrences must be recorded for the necessitation of further coordination, Observo is an interesting solution.

Where is the benefit of Observo?

With a central collection and uniform preparation and visualization of localized messages, work processes can be optimized and reaction times can be shortened. Systematic recording and analysis allow targeted measures to be taken and costs saved.

The localization on maps, configurable entry forms and uniform reports as well as the possibility to exchange objects and results via an interface with a central system allow flexible integration into existing work processes.

Application areas

- Maintenance of roads, paths, waterways
- Maintenance of infrastructure (structures, buildings, facilities etc.)
- Railways, public transport services, transport companies
- Forestry
- Nature, nature conservation, natural hazards, natural phenomena
- Energy, telecommunications
- Water, drainage
- Real estate
- Etc.

Localisation, documentation and coordination

The app can be downloaded onto every smartphone or tablet (iOs, Android, Windows). Presentation is adapted automatically to the respective device (Responsive Design). A client can be configured for each sphere of activity. Several spheres of activity may thus be covered by any given user.

As well as the possibility of simple recording of a straightforward or object-related observation (localisation via GPS, photos, text, voice message), personal map material can be integrated for each client (WMS services), individual objects can be imported and a personal, flexible recording formula such as a report (with map, photos, entries) may be configured.

An observation can be forwarded to several pre-configured users. Where required, it is also possible to transfer an observation to an existing application (central GIS system, product for maintenance etc.).

The application areas of Observo and the possibilities for integration into existing business processes are extremely diverse.

Test Observo free of charge

Observo can be downloaded and tested in the App-Store (Apple, Google, Windows). A simple, basic formula demonstrates the possibilities.

Configuration of a solution tailored to your requirements and the productive operation of Observo is not expensive.

We would be more than happy to discuss any queries regarding your personal assignments on a personal level.
